                                                                                                                  The enzyme acyl Coenzyme A-cholesterol acyltransferase 1 (ACATI) mediates sterol esterification, an important component of intracellular lipid homeostasis. The present sequence is the coding sequence of human ACAT Related Gene Product 2 (ARGP2/ACAT2). The enzyme encoded by the present sequence is a diacylglycerol acyltransferase (DGAT). ARGP2 esterifies cholesterol. Also, the activity of ARGP2 is relatively resistant to histidine active site modifier. ARGP2 is therefore a tissue specific sterol esterification enzyme.
                                                                 P.

                                                                                                                                                                                                                                                                                                                                                                           The present sequence encodes the human acyl CoA:cholesterol
acyltransferase designated ACAT-2. ACAT-2 polypeptides can be
acyltransferase designated ACAT-2. ACAT-2 polypeptides can be
administered therapeutically, especially by expressing encoding
complynucleotides, to treat individuals in need of ACAT-2 polypeptide.
CC polynucleotides, to treat individuals in need of ACAT-2 polypeptide.
CC polynucleotides administered to treat disease conditions
associated with elevated cholesterol ester levels e.g.
Chypertriglyceridaemia or hyperlipidaemia (including
hypertriglyceridaemia), since ACAT-2 catalyses the esterification of
cholesterol with fatty acyl CoA substrates. The polypeptides can also
cobe used to diagnose diseases related to polypeptide expression or
activity, by analysing for polypeptide presence or amount in a sample.
They are useful to screen for compounds inhibiting or activating the
polypeptide, which can be included in pharmaceutical compositions and
administered therapeutically to treat conditions associated with ACAT-2;
inhibitory agents can especially be used to inhibit ACAT-2 activity,
cinhibit ACAT-2 and not prior art ACAT-1.

They may especially be administered to treat disease conditions associated with elevated cholesterol ester levels e.g. hypercholesterolaemia or hyperlipidaemia (including hypertiglyceridaemia), since ACAT-2 catalyses the esterification of cholesterola, with fatty acyl coA substrates. The polypeptides can also be used to diagnose diseases related to polypeptide expression or activity, by analysing for polypeptide presence or amount in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polypeptide, useful to treat conditions associated with elevated sterol ester levels e.g. hypercholesterolemia

This isolated nucleic acid molecule encodes human acylcoenzyme A:cholesterol acyltransferase III (see AAW3407), or ACAT related gene product 2 (ARGP-2), whose expression appears to be restricted to the foetal liver, suggesting it to have a role in lipid metabolism during development. It was identified following database searching for human ACAT-related sequences and use of PCR and RACE to obtain full-length sequences. An isolated nucleic acid (see AAV01533) for human ARGP-1 (see AAW43406) was also identified. Also claimed are host vector systems for production of ARGP-1 and ARGP-1 colling and transgenic non-human mammals. ARGP-1 and ARGP-1 collingian imbalance in sterol levels due to a defect in esterification of sterol. A claimed oligonocleckide capable of specifically carefold. A calmed oligonocleckide capable of specifically collinging to a unique sequence of nucleotides in the isolated nucleic acid molecule, or a vector expressing the oligonoclectide. Can be used to inhibit wild-type ARGP-1 or ARGP-2. The wild-type enzymes can be used to identify an inhibitor, useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 961 CCTGTCTTTGCCAACATGAGCCGAGAGCCCTTCAGCACCCGTGCCCTTGGTGCTCTTATC 1020

It also allows the design of antisense DNAs or RNAs to inhibit ACAT prodction, or probes to identify different forms of human ACAT or ACAT from different animal species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This nucleic acid molecule encodes human acylcoenzyme A:cholesterol acyltransferase (see AAW43409), or ACAT I. The invention relates to isolated nucleic acids (see AAV01533-35) coding for human and mouse acylcoenzyme A:cholesterol acyltransferase II and III (see AAW443406-08), also designated ACAT related gene products (ARGP) I and 2. These can be used to identify inhibitors useful in the treatment of atherosclerosis and hyperlipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Acylcoenzyme A:cholesterol acyltransferase; ACAT I;

comprises an isolated nucleic acid molecule encoding yeast wild type acyl-coenzyme A:cholesterol acyltransferase 1 (ARE1) (see AAW38417) or 2 (ARE2) (see AAW38418) operatively linked to a promoter. The vector and a claimed host-vector system can be used for the recombinant production of ARE1 or ARE2. The products can be used to identify novel ARE1 or ARE2 inhibitors. ARE2 inhibitors can be used to treat arteriosclerosis or hyperlipidaemia, as well as to inhibit fungal growth or to treat fungal invasion (claimed).

relates to isolated nucleic acids (see AAV01533-35) coding for human and mouse acylcoenzyme A:cholesterol acyltransferase II and III (see AAW43406-08), also designated ACAT related gene products (ARGP) 1 and 2. These can be used to identify inhibitors useful in the treatment of atherosclerosis and hyperlipidaemia.
                                                                                                                                           Sequence 455 BP; 95 A; 121 C; 123 G; 116 T; 0 other;
